

UDYAAN

A playable layer for the idea-to-business course

Course Design Proposal
Version 1.0 · August 2026

The world can be weird. The learning must stay real.

The playable layer makes real course work easier to start and continue

A serious course experience with a strange, motivating world around it.

Map-based course layer

Shows current phase and next action

Calm lesson mode

Protects reading, practice, and focus

Real-world missions

Moves students into customer-facing work

Evidence-based progression

Unlocks progress through artifacts and reflection

Pilot approach

Tests one complete vertical slice first

Students understand lessons and still avoid the work that creates learning

Unclear orientation Students cannot identify the next meaningful action.

Action avoidance Conversations and outreach feel socially risky.

Rejection sensitivity A “no” is interpreted as a verdict, not information.

Invisible progress Work feels disconnected and repetitive.

Weak reflection Feedback is collected without a next decision.

The game frames the work, then sends students back into reality

Progress depends on real action and usable evidence. Decorative clicks do not count.

The layer earns its place through four learning behaviours

Orientation

Identify current phase, next action, and expected submission.

MAP SIGNAL

Momentum

Begin difficult work with a clear mission and completion rule.

MISSION

Emotional safety

Interpret rejection and confusion as evidence.

DATA, NOT DEFEAT

Social energy

See meaningful cohort progress and contribute to peers.

TEAM PULSE

Every course phase becomes a visible action, artifact, and decision

Proposed first-iteration draft. Validate the 13 subphases and eight major artifacts against course material.

Foglands helps students identify a problem outside their imagination

Learning objective	Separate assumptions from observed customer problems.
Student actions	Choose a customer group, conduct conversations, record language and patterns.
Artifacts	Conversation notes, observation log, pattern summary, problem hypothesis.
Mission example	Five customer conversations with relevant people.
Completion	Five attempts, useful notes, and a sharper hypothesis.

The Workshop turns evidence into an offer specific enough to test

Inputs

Customer · documented problem · desired result · promise · delivery · price logic

Major artifact

Field-ready offer and sales kit

Feedback question

Can a real person understand who it is for, what changes, and what happens next?

Completion

Offer is specific enough for outreach and testing.

Guardrail

Visual polish never substitutes for a clear value proposition.

The Chaos Arena converts market response into the next decision

Student actions

Outreach, present the offer, log response, classify signals, decide what changes.

Artifacts

Outreach log, objection / signal record, revised offer or next-action decision.

Response types

Interest · confusion · objection · no response · rejection · commitment

Completion

A documented attempt plus a reasoned next decision.

Reward logic

Attempts, interpretation, and iteration receive credit.

The lesson view keeps the course readable when concentration matters

What counts as a real problem?

Lesson objective

Identify a specific problem experienced by a defined group, using observed language and behaviour.

Practice prompt: write the strongest pattern from your conversations.

START REAL-WORLD MISSION

The map creates momentum. The lesson screen creates concentration.

No character animation enters the core reading and practice area.

Progress is earned through evidence, reflection, and the next decision

Evidence powers progress. Rewards show the student that the work moved.

VALIDATED PROGRESS = ACTION + REVIEWED EVIDENCE + REFLECTION + ITERATION

Proposed reward and social systems make persistence visible

Map unlocks

Verified milestones

Cosmetic rewards

Consistent action and recovery

Team recognition

Useful peer support

Leaderboard

Evidence, action, reflection, iteration

Surprise events

Completion moments

EXAMPLE: "SKIBIDI TOILET ATTACK" = RARE EVENT

One complete Foglands loop can test whether the layer adds value

Included in the proposed slice

- Map region and selected nodes
- Calm lesson screen
- Guided practice
- Customer-conversation mission
- Evidence submission
- Reflection prompt
- Progress update and one reward moment
- Basic cohort visibility

Decision enabled

Does the playable layer improve action and evidence enough to justify expansion?

Excluded for now: full world, complex combat, advanced leaderboard, automated scoring, broad infrastructure.

A small cross-disciplinary course lab can build the first slice

Workstream	Output	Validation
Course design	Node objectives, mission briefs, artifact standards	Curriculum owner
Interaction design	Progress states, feedback loop, reward rules	Learning-design review
Visual design + animation	Map, characters, UI, transitions	Design review
Engineering	Functional slice and evidence flow	Technical review
Testing / research	Student sessions and findings	Pilot lead

Status each resource as: confirmed · to confirm · required for expansion.

The pilot is judged by student behaviour, not visual novelty

**ORIENTATION**

Where am I, what is next, what must I submit?

ACTION

Do students complete the real-world mission?

EVIDENCE

Are artifacts specific, grounded, and usable?

REFLECTION

Can students explain what changed?

ITERATION

Do next actions change after feedback?

PERSISTENCE

Do students return after rejection?

DECISION REQUEST

Approve the specification and the Foglands vertical slice

- 1 Confirm the detailed course mapping.
- 2 Confirm available people and time.
- 3 Approve Foglands as the first slice.
- 4 Agree the pilot cohort, timeline, and evidence-review process.
- 5 Review results before expansion.

Build the smallest strange world that proves students do better real work inside it.
