

A COURSE WITH A MAP

A playful visual layer for turning ideas into real businesses.

THE GAME IS THE NAVIGATION LAYER

Students still do the real work. The map makes the work visible, motivating, and easier to continue.

A playful, unpredictable world around serious learning.

The game layer gives the course a visible structure, a reason to return, and a more enjoyable way to face uncomfortable work.

WHAT THE LAYER ADDS

- ORIENTATION**
Shows where to go and what evidence is required.
- MOMENTUM**
Turns difficult work into visible missions.
- EMOTIONAL SAFETY**
Makes rejection useful to interpret.
- SOCIAL ENERGY**
Rewards persistence and cohort progress.

COURSE DATA THE GAME MUST SUPPORT

3 REGIONS	13 SUBPHASES	8 MAJOR ARTIFACTS	1 REPEATABLE LOOP
--------------	-----------------	----------------------	----------------------

The world can be weird. The learning must stay real.

The game gives the learning a world to live in.

The student does not progress by clicking through content. They progress by producing evidence, reflecting on what happened, and making the next business decision.

EVERY GAME NODE MUST MAP TO A REAL COURSE ACTION

Assignment becomes mission. Submission becomes evidence. Evidence unlocks the next decision.

Three regions. One real expedition.

Each region is a visual explanation of a real course phase. The strange world is a harness around the curriculum, not a replacement for it.

THE FOGLANDS

Find what is actually happening.

THE RULE

CHAOS ARENA

Take it into the market and see what survives.

The map can be absurd. The student output cannot be vague.

Find a problem outside your imagination.

Students choose a customer group, investigate reality, and return with evidence.

MISSION ACTIVE

Survive five conversations with people who have no idea who you are.

Success is not five yeses. Success is five attempts, useful notes, and a better problem hypothesis.

FIELD PROGRESS

3 / 5 conversations

REJECTION DATA ACQUIRED

Get your superweapon.

Students combine a documented problem, a desired result, a specific promise, a delivery method, and price logic into an offer that can survive contact with a real customer.

TOO VAGUE / ADD EVIDENCE

UNSTABLE BUT INTERESTING

READY FOR FIELD TEST

If it tries to solve everything, it explodes.

Enter the Chaos Arena.

The superweapon leaves the workshop. Reality gets a vote. Every response becomes market intelligence.

OUTREACH

08

BUYING SIGNAL

01

OFFER DAMAGE

03

ITERATION

02

The arena rewards attempts, interpretation, delivery, and adaptation - not just successful sales.

A map node opens into real work.

The interface creates momentum. The lesson page creates concentration.

LESSON VIEW / CALM MODE

What counts as a real problem?

The student reads, watches, practises, then leaves the screen to speak to real people.

START MISSION

One clear interaction from the map to the actual lesson.

The game should frame the work, then get out of the way.

MAKING IT POSSIBLE

A cross-disciplinary course lab.

The system requires a small cross-disciplinary team that can connect curriculum, interaction, visual storytelling, and interface design into one coherent student experience.

ANIMATION

Character movement, region scenes, mission transitions

GAMING

Map navigation, interactions, lightweight prototype logic

DESIGN

UI, map composition, visual identity, assets

COURSE INTERNS

Curriculum connection, missions, content coordination

PRODUCTION RULE

Build one vertical slice before building the whole universe.

The game earns its place through student behaviour.

The question is not whether the world looks impressive. The question is whether students understand the journey, take more real-world action, and produce better evidence.

OBSERVATION SHEET / COURSE EXPERIMENT 01

- **ORIENTATION** Can students answer: where am I, what is next, and what must I submit?
- **ACTION** Do more students complete interviews, outreach, testing, and delivery?
- **EVIDENCE** Are the problem statements, offers, and next decisions clearer?
- **PERSISTENCE** Do students return after rejection and use feedback to iterate?

THE CAUSAL CHAIN

If the chain breaks, the game is decoration. If the chain holds, it is a value-add.
