

Finance learning plan

Purpose

Build the ability to understand how a business earns and spends money, decide where limited money and time should go, fund growth responsibly, and build lasting value.

Why this matters

I want to learn how to use limited resources well before I am responsible for larger amounts of money. The real context is scalable businesses enabled by technology.

What I need from Sir

- Help choose the books and chapters that best answer the first questions.
- Help sequence the questions so each cycle builds useful knowledge for the next.
- Review weekly work, identify weak assumptions or missing knowledge, and guide the next cycle.

Document purpose: give Sir a clear view of the capability, method, and support required.

The capability I want to build

The curriculum follows four connected abilities. Each answers a different kind of business decision.

The first two abilities are the immediate focus. Funding and long-term value follow as the work requires them.

The questions that will drive the learning

Each question creates a reason to learn the concepts beneath it. The goal is usable understanding, not detached coverage of chapters.

Starting question	What it forces me to learn
How do I decide what to charge for a solution?	Customer value, cost, price, and what remains after delivery.
How do I decide where the next rupee and hour should go?	Comparing product, customers, team, tools, research, and operations.
How do I build a financial model?	Assumptions, customer numbers, costs, cash, and different possible outcomes.
How do I fund and raise money responsibly?	Customer income, borrowing, grants, investors, ownership, and control.
How do I build a more valuable business over time?	Product, systems, customers, reputation, intellectual property, and team.

Working principle

Start with the business question. Identify the knowledge required to answer it. Learn and use that knowledge immediately.

How each question becomes applied learning

The method makes the learning visible. Each cycle ends with work that can be reviewed, challenged, and improved.

1

Choose one question

Name the business decision that matters now.

2

Find the missing knowledge

Identify the ideas, methods, and evidence needed for an answer.

3

Read and build

Use the relevant book chapters and course material to build a first model or analysis.

4

Apply the work

Test the model in a real or realistic business situation.

5

Present and revise

Show the work each week, use feedback to find gaps, and improve the next version.

The first learning cycle

First question

How do I decide what to charge for a solution, and whether it creates enough value?

Element	First-cycle work
Learn	Customer value, price, cost, cash, and the money remaining after delivery.
Build	A simple pricing and cost model with visible assumptions.
Apply	Use a real or realistic business problem to test the model.
Present	Show the model, evidence used, assumptions made, and remaining gaps.
Ask Sir	Which book chapters and examples should guide this first cycle?

Exit criterion: the first model clearly links customer value, price, cost, and the assumptions that still need evidence.

The support I need from Sir

Sir does not need to teach every topic in a fixed order. His role is to help direct the questions toward the right sources, standards, and next learning gap.

What I need	What this gives the learning
Book and chapter selection	Source material matched to the actual question, instead of a broad reading list.
Question sequencing	A sequence where each answer provides the knowledge needed for the next decision.
Weekly review	Feedback on weak assumptions, missing ideas, and the quality of the model or analysis.

Weekly presentation format

- The question worked on.
- The evidence and reading used.
- The model, analysis, or decision tool built.
- What feedback changed and what question follows next.

What progress will look like

Progress is visible in the decisions and tools produced, not in notes collected. Each output becomes evidence for the next review.

Learning area	Evidence of progress
Pricing	A model showing customer value, cost, price, and assumptions.
Spending decisions	A comparison of a hire, tool, or research spend against its alternatives.
Financial modelling	A connected model that updates when an assumption changes.
Financial planning	A plan for expected, strong, and difficult conditions.
Funding	A comparison of funding choices and their consequences.
Long-term value	A written view of what would make the business durable and valuable.

Next step

Agree the first question, select the book chapters, and begin the pricing and cost model in the first cycle.
